IPS: Issues

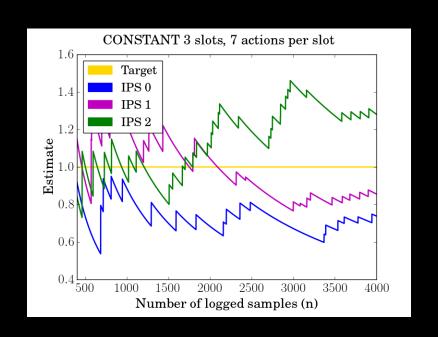

$$\widehat{U}_{\rm ips}(\pi) = \frac{1}{n} \sum_{i} \frac{\pi(y_i|x_i)}{\pi_0(y_i|x_i)} \delta_i$$

$\widehat{E}[Constant] \neq Constant$

Two variables in IPS

$$> \pi(y|x)/\pi_0(y|x)$$

Suppose $\delta \equiv 1$

Fix: Control Variates

Use correlated quantities to control $\pi(y|x)/\pi_0(y|x)$ variability $E[s_i] = \theta$ known

<u>Multiplicative</u>

Additive

$$\frac{\theta}{E[s]} E\left[\frac{\pi(y|x)}{\pi_0(y|x)}\delta\right]$$

$$E\left[\frac{\pi(y|x)}{\pi_0(y|x)}\delta - s\right] + \theta$$

e.g. Self-Normalization

e.g. Doubly Robust Estimator

Self-Normalized Estimator

Use expected sample size as multiplicative control variate

$$\hat{s}(\pi) = \frac{1}{n} \sum_{i} \frac{\pi(y_i | x_i)}{\pi_0(y_i | x_i)}$$
 $E[\hat{s}(\pi)] = 1$

$$\widehat{U}_{\text{SNips}}(\pi) = \frac{\sum_{i} \frac{\pi(y_i|x_i)}{\pi_0(y_i|x_i)} \delta_i}{\sum_{i} \frac{\pi(y_i|x_i)}{\pi_0(y_i|x_i)}}$$

Self-Normalization: Properties

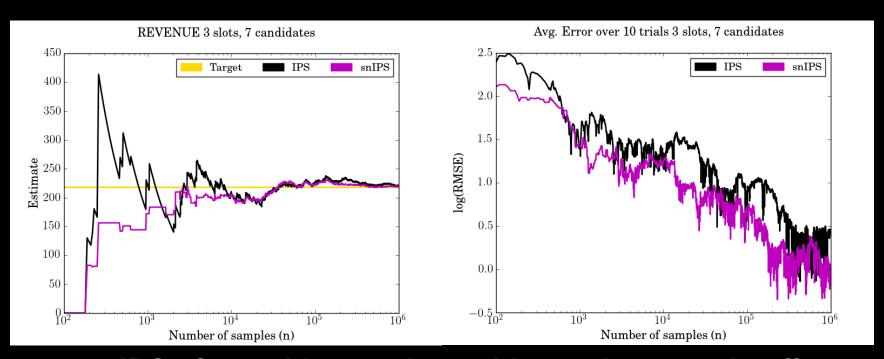

$$\widehat{E}[Constant] = Constant$$

Equivariant

Asymptotically consistent
$$\Pr\left(\lim_{n\to\infty}\widehat{U}_{\mathrm{SNips}}(\pi)=U(\pi)\right)=1$$

Small bias which decays $O(\frac{1}{n})$ while variance decays $O(\frac{1}{\sqrt{n}})$

News Recommender: Results

snIPS often achieves a better bias-variance trade-off

Doubly Robust Estimator

Reward Prediction

$$\widehat{U}_{\rm rp}(\pi) = \frac{1}{n} \sum_{i} E_{y \sim \pi \mid x_i} [\widehat{\delta}(x_i, y)]$$

Low variance, High bias

<u>IPS</u>

$$\widehat{U}_{\text{ips}}(\pi) = \frac{1}{n} \sum_{i} \frac{\pi(y_i|x_i)}{\pi_0(y_i|x_i)} \delta_i$$

High variance, No bias

$$\widehat{U}_{\mathrm{dr}}(\pi) = \frac{1}{n} \sum_{i} \frac{\pi(y_i|x_i)}{\pi_0(y_i|x_i)} \left(\delta_i - \widehat{\delta}(x_i, y_i)\right) + E_{y \sim \pi|x_i} [\widehat{\delta}(x_i, y)]$$

Doubly Robust: Properties

Useful when using estimated propensities

$$\hat{p}_i \approx \pi_0(y_i|x_i)$$

Unbiased if, either
$$\hat{\delta}(x, y) = \delta(x, y)$$

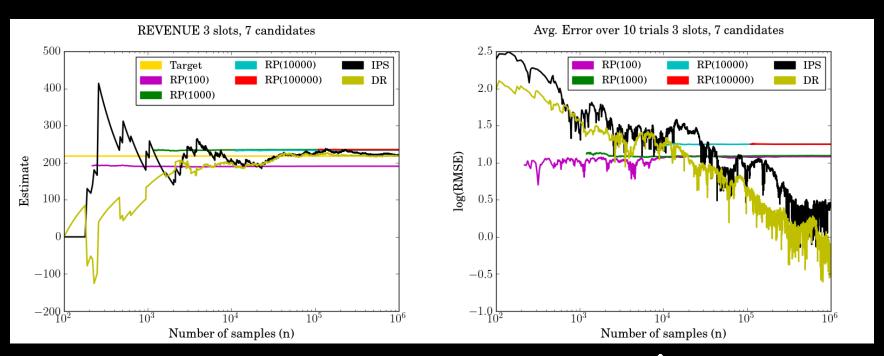

Or,

$$\hat{p}_i = \pi_0(y_i|x_i)$$

Default in Vowpal Wabbit

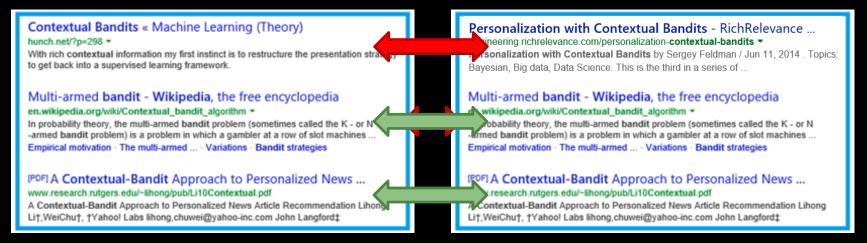

http://hunch.net/~vw/

News Recommender: Results

DR dominates IPS even with a noisy $\hat{\delta}(x, y)$

Evaluating rankings (slates)

i

 $\pi(x_i)$

Exact match of composite actions in logs unlikely Idea: Count per-slot matches

Slates Estimator

If π_0 samples l documents from a multinomial $\mu(d|x)$, with replacement

$$\widehat{U}_{\text{slates}}(\pi) = \frac{1}{n} \sum_{i} \left(1 - l + \sum_{j=1}^{l} \frac{\mathbb{I}\{y_i[j] = \pi(x_i)[j]\}}{\mu(y_i[j]|x_i)} \right) \delta_i$$

For general π_0 , need to record $\pi_0(y[j] = d, y[k] = d'|x)$

Slates Estimator: General π_0

Define:

$$\Gamma_{\pi_0(x)}[d,j;d',k] = \pi_0(y[j] = d,y[k] = d'|x)$$

$$\mathbb{1}_y[d,j] = \mathbb{I}\{y[j] = d\}$$

$$\widehat{U}_{\text{slates}}(\pi) = \frac{1}{n} \sum_{i} E_{y \sim \pi \mid x_i} [\mathbb{1}_y^T] \Gamma_{\pi_0(x_i)}^{\dagger} \mathbb{1}_{y_i} \delta_i$$

Can also develop self-normalized/doubly robust variants

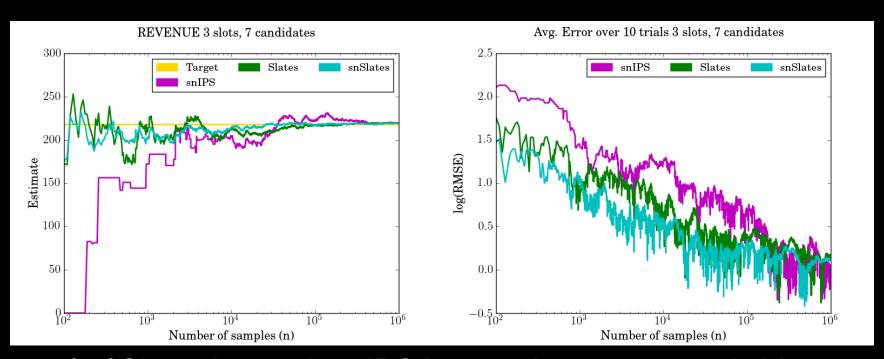

Slates Estimator: Properties

- Typically, exponentially better sample complexity than IPS
- Unbiased if reward decomposes per-slot

$$\exists \Phi_{\chi} \text{ s.t. } \delta(\chi, y \coloneqq | \chi | \chi) = \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi | \chi) + \Phi_{\chi}(| \chi) + \Phi_{\chi}(|$$

Can capture higher-order interactions with suitable $\Gamma_{\pi_0(x)}$

News Recommender: Results

(sn)Slates better than IPS but can have asymptotic bias

Yahoo Front Page

 $y \sim \pi(x)$ Pick STORY $\in \{F1, ... F20\}$ to highlight for different users

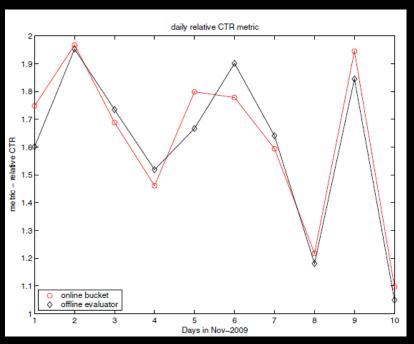

Metric δ : CTR

Logging π_0 : Uniform random

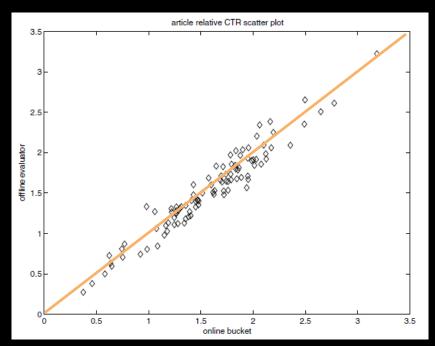

Setup: Deploy policies, check online ↔ IPS correlation

Yahoo Front Page: Case Study

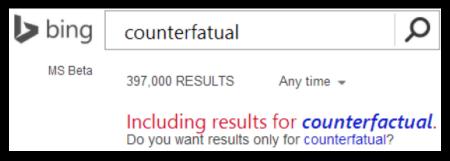

IPS is quite accurate for several (spatio-temporal) policies

Yahoo Front Page: Case Study

IPS indeed gives unbiased CTR estimates for different articles

Bing Speller

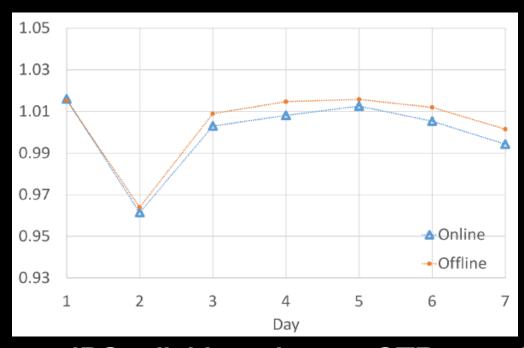

Pick (possibly many) reformulation candidates

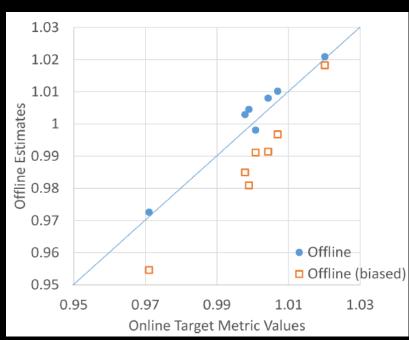

Logging π_0 : Independent Bernoulli per rank

$$\Pr(\operatorname{Pick} d_j) = 1/(1 + \alpha \exp[\beta\{\operatorname{score}(d_j) - \operatorname{score}(d_1)\}])$$

Setup: Deploy policies, check online ↔ IPS correlation

Bing Speller: Case Study

IPS reliably estimates CTR, etc. despite non-uniform logging

Evaluation: Key Questions

How can we estimate $U(\pi)$ using logged data from π_0 ?

What system π_0 to deploy?

To enable reliable counterfactual estimation

If possible,

stochastic with logged randomization

If not,

log enough to estimate propensities \hat{p}_i

How to explore?

Uniform?

typically, bad

"Around current system"?

"less risk" & "better targeted"

What should we record?

Log EVERYTHING!

$$\langle x_i, y_i, \delta_i, \mathbf{p_i} \rangle$$

To reliably "replay" π on logged data,

Candidate set of actions

 $\{Y_i\}$

Features for each candidate

 $\{f(x_i,y)\}$

Action at the point of randomization

 y_i

How can we evaluate $U(\pi)$?
